Project Summary: A long relationship with the Town of Plainfield has provided Butler Fairman & Seufert Inc with the opportunity to develop and refine the Town’s engineering, development and construction processes.

As a result Butler, Fairman & Seufert Inc. has developed a custom web based software package for the Town, incorporating project tracking and a document management system. This is intended to be another step to refinement of processes as the Town continues to grow. The software package simply called “Project Manager” currently has the ability to track active projects, research past projects and maintain links to documents relating to the projects. Revisions and updates to the Project Manager can be done as determined or as needed by the Town.

ESRI users can also access project data geographically through event based features. This should allow for any project mapping needs and promotes access to ESRI’s wealth of tools. Functionality is however somewhat limited between the two software’s at this time, but as the needs develop so will the functionality.
